(54) Title: METHOD AND APPARATUS FOR INTERFEROMETRIC MODULATION OF LIGHT

(57) Abstract: An interferometric light modulator includes a base and a ribbon suspended above the base. The ribbon has a central region and first and second conducting regions located outside of the central regions. The base includes a second mirror located paralell and adjacent to the first mirror so that the first and second mirrors form an interferometric cavity. An electrical bias applied to the first and second conducting regions adjusts the interferometric cavity in order to modulate light which is incident upon the central region of the ribbon. In an alternative interferometric light modulator, the light is incident upon a second central-region of the base.
